From Wikipedia, the free encyclopedia

In [mathematics](#) and [combinatorics](#), a **centered hexagonal number**, or **hex number**,<sup>[1][2]</sup> is a [centered figurate number](#) that represents a [hexagon](#) with a dot in the center and all other dots surrounding the center dot in a [hexagonal lattice](#). The following figures illustrate this arrangement for the first four centered hexagonal numbers:

Centered hexagonal numbers should not be confused with [cornered hexagonal numbers](#), which are figurate numbers in which the associated hexagons share a vertex.

The sequence of hexagonal numbers starts out as follows (sequence [A003215](#) in the [OEIS](#)):

Centered hexagonal numbers appearing in the [Catan](#) board game:  
 19 land tiles,  
 37 total tiles

⇒ [C is the greenest programming language](#)

Greenest meaning least impactful on the Earth environment. Combined with its portability, C might be the best language for the most sustainable systems.

⇒ [Rob Pike: Notes on Programming in C](#)

A read.

⇒ [aiju: Notes On Programming In C](#)

Do not use const or restrict. const does not have any effect during runtime. restrict can introduce extra bugs. Both have no real use.

Many people seem to like const claiming that it "prevents bugs". I'm honestly not sure if I have ever come across a single bug that would have been prevented by const. Even if there is the odd examples for which it is true, const is a cancer that spreads through entire codebases as the only sane way to use it is to use it consistently (or else you require casts which could mask real bugs). Considering that it serves little to no purpose it's, in my opinion, just not worth effort. If you do find yourself stuck with code that insists on it, the magic incantation is `#define const`.

⇒ [Си должен умереть?](#)

Как программист на Си я думаю, что до современним меркам этот язык довольно плох

**Laurence Tratt: Four Kinds of Optimisation**  [Edit](#)

[tratt.net/laurie/blog/2023/four\\_kinds\\_of\\_optimisation.html](http://tratt.net/laurie/blog/2023/four_kinds_of_optimisation.html)

1. Use a better algorithm.
2. Use a better data-structure.
3. Use a lower-level system.
4. Accept a less precise solution.

Pick the simplest solution.
